

Computing Research Project

Three steps to writing a good question

Step 1: Articulate your topic

Think about the following questions:

What do you know
about this topic?

What aspects of this
topic most interest you?

Step 2: Consider what you don't know about your topic

This will help you to determine what you need to research

Step 3: Start drafting your research question

A good research question will tell you what information you need to answer it

A good research question is

not a

YES

question

and not a

NO

question

A yes or no question might be:

Is cannabis bad for you?

You could change the 'is' to
'how' or 'why' or 'what', for
example:

What are the bad effects of
cannabis?

A good research question does
not use value words, for example:

don't use

or

You could change this to:

What are the physiological and
psychological effects of cannabis
use?

A good research question is

not too

and not too

Our draft research question

What are the physiological and
psychological effects of cannabis
use?

might be too broad

We could narrow the scope
by setting limits, e.g. by
focusing on:

a particular population

time period

location, etc.

For example:

What are the physiological and
psychological effects of cannabis
use in adolescents?

Or:

What are the physiological and
psychological effects of cannabis
use in cancer patients?

Or even:

What are the short term and long term
effects of cannabis use in adolescents?

Lastly, make the journey
part of the reward.

"It's not the answer that gets you the
Nobel Prize, it's the question."

Dr Karl Kruszelnicki
